C Programming Basic – week 10

Sorting

Lecturers :

Cao Tuan Dung

Le Duc Trung

Dept of Software Engineering

Hanoi University of Technology

Topics of this week

- Elementary Sorting Algorithm
 - Insertion
 - Selection
 - Bubble (exchange)
- Heap sort Algorithm

Insertion sort

- Strategy of Card Players
- Sorts list by
 - Finding first unsorted element in list
 - Moving it to its proper position
 - Efficiency: $O(n^2)$

Original List

Apter step 1

Apter step 2

Apter step 3

Apter step 4

Apter step 5

unsorted

Insertion Sort

```
void insertion_sort(element list[], int n)
{
    int i, j;
    element next;
    for (i=1; i<n; i++) {
        next= list[i];
        for (j=i-1; j>=0 && next.key< list[j].key; j--)
            list[j+1] = list[j];
        list[j+1] = next;
    }
}
```

Selection sort

- Sorts list by
 - Finding smallest (or equivalently largest) element in the list
 - Moving it to the beginning (or end) of the list by swapping it with element in beginning (or end) position

Selection sort

```
void selection(element a[], int n)
{ int i, j, min, tmp;
  for (i = 0; i < n-1; i++){
    min = i;
    for (j = i+1; j <= n-1 ; j++)
      if ( a[j].key < a[min].key)
        min = j;
    tmp= a[i];
    a[i]= a[min]);
    a[min] = tmp;
  }
}
```

Exercise

- We assume that you make a mobile phone's address book.
- At least, we want to write a program that can store about 100 structure data with name and phone number and e-mail address.
- Read about 10 data from an input file to this structure, and write the data that is sorted in ascending order into an output file.
- Use the insertion sort and selection sort
- (1) Write a program that uses array of structure
- (2) Write a program that uses singly-linked list or doubly-linked list.
- In both program, print out the number of comparisons made during the sorting process of each algorithm.

Heap sort

- Heap: a binary tree which
 - The root is guaranteed to hold largest node in tree
 - Smaller values can be on either right or left sub-tree
 - The tree is complete or nearly complete
 - Key value of each node is \geq to key value in each descendent

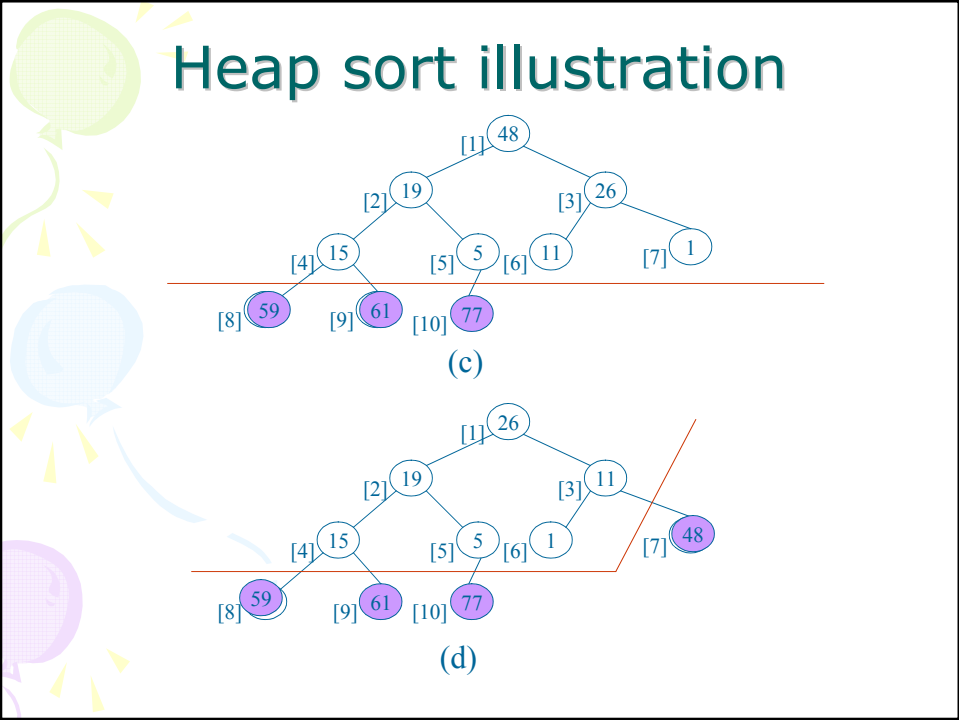

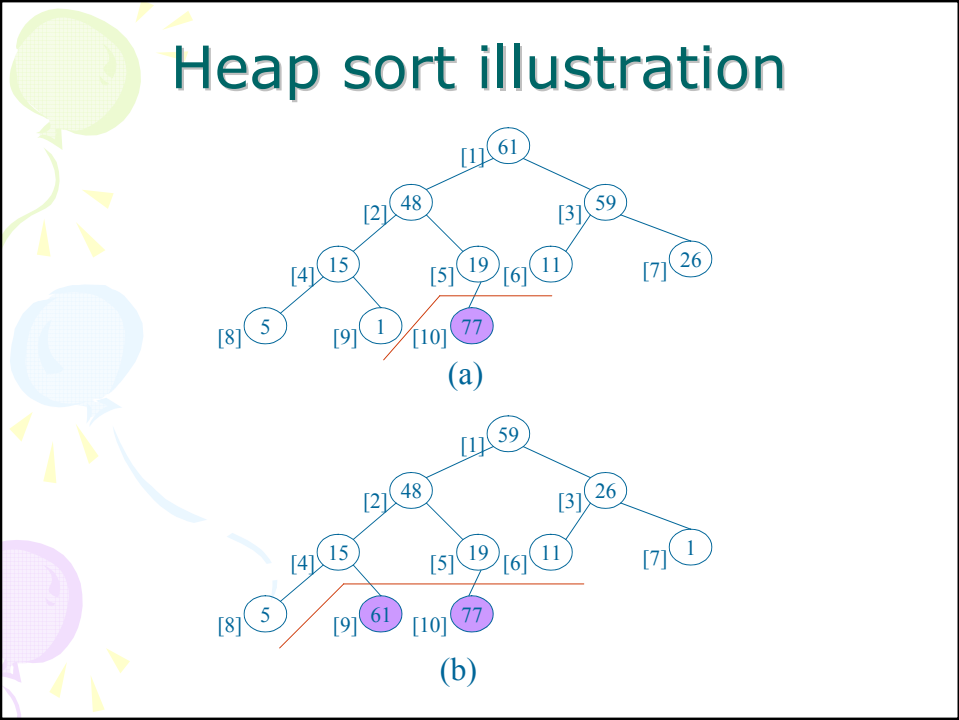

Heap sort

Array interpreted as a binary tree

1	2	3	4	5	6	7	8	9	10
26	5	77	1	61	11	59	15	48	19

input file

Heap sort

```
void adjust(element list[], int root, int n)
{
    int child, rootkey;    element temp;
    temp=list[root];      rootkey=list[root].key;
    child=2*root;
    while (child <= n) {
        if ((child < n) &&
            (list[child].key < list[child+1].key))
            child++;
        if (rootkey > list[child].key) break;
        else {
            list[child/2] = list[child];
            child *= 2;
        }
    }
    list[child/2] = temp;
}
```

Heap sort

```
void heapsort(element list[], int n)
{
    ascending order (max heap)
    int i, j;
    element temp;
    for (i=n/2; i>0; i--) bottom-up adjust(list, i, n);
    for (i=n-1; i>0; i--) { n-1 cycles
        SWAP(list[1], list[i+1], temp);
        adjust(list, 1, i); top-down
    }
}
```

Heap sort

Max heap following first **for** loop of *heapsort*

Exercise

- We assume that you make a mobile phone's address book.
- At least, we want to write a program that can store the declared about 100 structure data with name and phone number and e-mail address.
- Read the about 10 data from an input file to this structure, and write the data that is sorted in ascending order into an output file.
- Use the heap sort. Print out the number of comparisons.

Exercise: Comparison of running time

- Write a program to initiate an array of 500 integers by using random function.
- Sort this array using insertion sort and heap sort. Calculate the running time of program in each case and print out the results.

Help

- **function for generating random numbers:** `srand(time(NULL))` and `rand()`

- **Time functions**

```
#include <time.h>
time_t t1,t2;
time(&t1);
/* Do something */
time(&t2);
durationinseconds = (int) t2 -t1;
```

Exercise

- Input 10 words from the standard input, and load them to a character type array.
- Sort the array by insertion sort, and output the sorted array into the standard output.

Hints

- You can write a program that processes in the following order.
 - 1. Declare `char data[10]`.
 - 2. Read every 1 word from the standard input by `fgetc()` function and load it on the array "data".
 - 3. Do the insertion sort to the array "data"
 - 4. Output every 1 word of the value of the sorted array "sort" by `fputc()` function.
